

How to Set Up Your Discord Bot (Python) on Windows

Step 1: Unzip the Bot Code

Find the zipped file I gave you (like 'my-discord-bot.zip').

Right-click it and choose Extract All...

Pick a folder (for example, C:\MyDiscordBot) and click Extract.

Step 2: Get Your Discord Bot Token

Go to this website: <https://discord.com/developers/applications>

Log in and open your bot application.

Click Bot on the left side.

Click Copy under TOKEN - this is your bot's secret password.

Step 3: Set Your Bot Token in Windows PowerShell

Press the Windows key and type PowerShell, then open it.

In PowerShell, type this command and press Enter:

```
setx DISCORD_TOKEN "paste-your-token-here"
```

Replace paste-your-token-here with the token you copied (keep the quotes).

Close PowerShell and open it again (this makes the change work).

Step 4: Go to Your Bot Folder in PowerShell

Open PowerShell.

Type this command and press Enter (change the folder if needed):

```
cd C:\MyDiscordBot
```

Step 5: Install Python Libraries Your Bot Needs

In PowerShell, type:

```
pip install -r requirements.txt
```

This will install all tools your bot needs to run.

Step 6: Run Your Bot

In PowerShell, type:

```
python bot.py
```

Your bot will start running. If you see messages in PowerShell, it means it's working!

Step 7: Add Your Bot to Your Discord Server

Go back to <https://discord.com/developers/applications>.

Open your app, then click OAuth2 > URL Generator.

Under SCOPES, check bot.

Under BOT PERMISSIONS, pick the permissions your bot needs (like sending messages).

Copy the URL at the bottom.

Paste that URL into your browser.

Pick your Discord server and add the bot.

Tips

- Keep PowerShell open while your bot is running.
- Close PowerShell to stop the bot.
- Don't share your bot token with anyone!
